RECIRCULATING SYSTEM BASICS

Water is supplied to each fiberglass purging tank by 40 mm PVC pipes. Water enters tank through 6 x inlet hoses c/w control valves. Each tank has additional aeration supplied by the diaphragm air pump. Water flows into the tank, through and then out via a stand pipe that sets the waters depth in the tank. Water is filtered by the pantera sand filter and U filter. Recirculated around the system by the Onga Pool Pump.
